Midterm Seatwork # 2 - Smart Wallet System

(1)

```
import java.util.Scanner;

public class SmartWalletSystemArcilla {
    public static void main (String[] args) {
        double balance = 5000.0;
        int transacTracker = 0;
        double cashIn = 0.0;
        double send = 0.0;
        Scanner input = new Scanner (System.in);

        while (true) {
            System.out.println("\n ===== SMART WALLET MENU =====");
            System.out.println("1. View Balance");
            System.out.println("2. Cash In");
            System.out.println("3. Send Money");
            System.out.println("4. Exit");

            System.out.print("\n Enter your choice:");
            int userChoice = input.nextInt();
            input.nextLine();

            if (userChoice == 4) {
                System.out.println("Exiting...");
                input.close();
                break;
            }

            switch (userChoice) {
                case 1:
                    System.out.println("Balance : " + balance);
```

```
transacTracker += 1;  
break;
```

case 2 :

```
System.out.print("Amount to cash in : ");  
cashIn = input.nextDouble();  
if (cashIn > 0) {  
    balance += cashIn;  
    System.out.println("cashIn + " is added to your wallet");  
    transacTracker += 1;  
} else {  
    System.out.println("Must not be 0 or negative");  
    cashIn = 0;  
    break;
```

case 3 :

```
System.out.print("Enter the recipient's # : ");  
String recipient = input.nextLine();
```

```
System.out.print("Enter the amount to send : ");  
send = input.nextDouble();
```

```
if (send < balance) {  
    if (send < 100) {  
        System.out.println("In Minimum amount must be 100");  
    } else if {  
        System.out.println("In Amount must not exceed 1500");  
    } else {  
        balance -= send;  
        transacTracker += 1;  
        System.out.println("In " + send + " is sent to " + recipient);  
    }  
}
```

```
    } else {
```

```
        System.out.println("Amount exceeds current balance");
```

```
        break;
```

```
    }
```

```
    send = 0;
```

```
    break;
```

```
    default :
```

```
        System.out.println("Choose between 1-4 only");
```

```
        continue;
```

```
    }
```

```
    System.out.println("In Successful Transactions = " + transacTracker);
```

```
}
```

```
System.out.println("Thank you for using Smart Wallet!");
```

```
}
```

```
}
```

2. Sample Execution

Transaction 1:

Enter your choice : 1

Balance : 5000.0

Successful Transactions = 1

Transaction 2:

Enter your choice : 2

Amount to cash in : 1000

1000.0 is added to your wallet

Successful Transactions = 2

Transaction 3:

Enter your choice : 3

Enter the recipient's # : 09981291675

Enter the amount to send : 50

Minimum amount must be 100

Successful Transactions = 2

Transaction 4:

Enter your choice : 1

Balance : 6000.0

Successful Transactions = 3

3. Short Explanation

- The while loop keeps the program running repeatedly because a loop will happen as long as the condition is evaluated as true. That is the reason why "While(true)" in my code produces a continuous loop until 4 is entered. The switch-case controls the menu selection by performing only the specific actions that correspond to the option that was chosen by the user. The type of transaction or its order of execution will depend on what case is entered. And lastly, the if-else statements validate the transactions by checking if conditions like minimum / maximum amount and current balance are met and then displaying accurate outputs or performing the appropriate actions.
